Question

Let P and Q be the points of trisection of the line segment that join the points A (2,-2) and B (-7,4) such that P is closer to A. Find the coordinates of P and Q.

formula

D divides BC in the ratio k:1,

$$D = \frac{kC + B}{k + 1} \tag{1}$$

Theoretical Solution

Let
$$\mathbf{A} = \begin{pmatrix} 2 \\ -2 \end{pmatrix}, \mathbf{B} = \begin{pmatrix} -7 \\ 4 \end{pmatrix}$$
 (2)

Point P (Further to A, Ratio 2: 1):

$$\mathbf{P} = \begin{pmatrix} \mathbf{A} & \mathbf{B} \end{pmatrix} \begin{pmatrix} \frac{2}{3} \\ \frac{1}{3} \end{pmatrix} \tag{3}$$

$$\implies \mathbf{P} = \begin{pmatrix} 2 & -7 \\ -2 & 4 \end{pmatrix} \begin{pmatrix} \frac{2}{3} \\ \frac{1}{3} \end{pmatrix} \tag{4}$$

(5)

$$\mathbf{P} = \begin{pmatrix} \frac{1 \times (-7) + 2 \times 2}{3} \\ \frac{1 \times 4 + 2 \times (-2)}{3} \end{pmatrix} = \begin{pmatrix} -1 \\ 0 \end{pmatrix}$$
 (6)

Point Q (Nearer from A, Ratio 1: 2):

$$\mathbf{Q} = \begin{pmatrix} \mathbf{A} & \mathbf{B} \end{pmatrix} \begin{pmatrix} \frac{1}{3} \\ \frac{2}{3} \end{pmatrix} \tag{7}$$

$$\implies \mathbf{Q} = \begin{pmatrix} 2 & -7 \\ -2 & 4 \end{pmatrix} \begin{pmatrix} \frac{1}{3} \\ \frac{2}{3} \end{pmatrix} \tag{8}$$

$$\mathbf{Q} = \begin{pmatrix} \frac{2 \times (-7) + 1 \times 2}{3} \\ \frac{2 \times 4 + 1 \times (-2)}{3} \end{pmatrix} = \begin{pmatrix} -4 \\ 2 \end{pmatrix}$$
 (10)

$$\mathbf{P} = (-1, 0) \qquad \mathbf{Q} = (-4, 2)$$
 (11)

(9)
